CS 473 ✧ Spring 2020

Homework 9

Due Wednesday, April 22, 2020 at 9pm

---

1. Every year, Professor Dumbledore assigns the instructors at Hogwarts to various faculty committees. There are n faculty members and c committees. Each committee member has submitted a list of their *prices* for serving on each committee; each price could be positive, negative, zero, or even infinite. For example, Professor Snape might declare that he would serve on the Student Recruiting Committee for 1000 Galleons, that he would *pay* 10000 Galleons to serve on the Defense Against the Dark Arts Course Revision Committee, and that he would not serve on the Muggle Relations committee for any price.

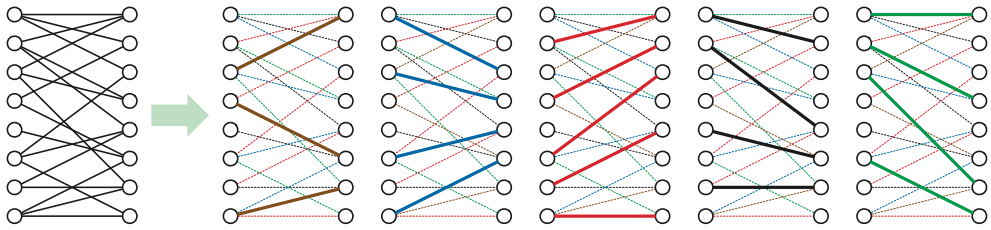
   Conversely, Dumbledore knows how many instructors are needed for each committee, and he has compiled a list of instructors who would be suitable members for each committee. (For example: "Dark Arts Revision: 5 members, anyone but Snape.") If Dumbledore assigns an instructor to a committee, he must pay that instructor's price from the Hogwarts treasury.

   Dumbledore needs to assign instructors to committees so that (1) each committee is full, (3) no instructor is assigned to more than three committees, (2) only suitable and willing instructors are assigned to each committee, and (4) the total cost of the assignment is as small as possible. Describe and analyze an efficient algorithm that either solves Dumbledore's problem, or correctly reports that there is no valid assignment whose total cost is finite.

2. Let $G = (L \sqcup R, E)$ be a bipartite graph, whose left vertices L are indexed $\ell_1, \ell_2, \ldots, \ell_n$ and whose right vertices are indexed $r_1, r_2, \ldots, r_n$. A matching M in G is ***non-crossing*** if, for every pair of edges $\ell_i r_j$ and $\ell_{i'} r_{j'}$ in M, we have $i < i'$ if and only if $j < j'$. If we place the vertices of G in index order along two vertical lines and draw the edges of G as straight line segments, a matching is non-crossing if its edges do not cross.

   Describe and analyze an algorithm to find the smallest number of disjoint non-crossing matchings $M_1, M_2, \ldots, M_k$ that cover G, meaning each edge in G lies in exactly one matching M_i.

   [Hint: How would you compute the largest non-crossing matching in G?]



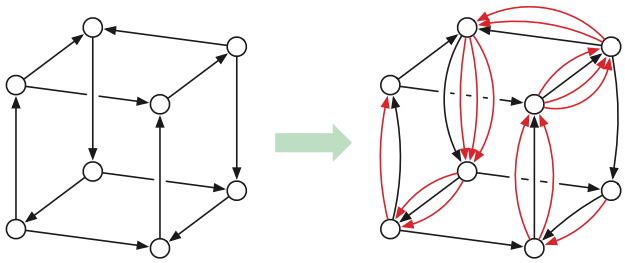
Decomposing a bipartite graph into non-crossing matchings.

3. An *Euler tour* in a directed graph G is a closed walk (starting and ending at the same vertex) that traverses every edge in G exactly once; a directed graph is *Eulerian* if it has an Euler tour. Euler tours are named after Leonhard Euler, who was the first person to systematically study them, starting with the Bridges of Königsberg puzzle.

   (a) Prove that a directed graph G with no isolated vertices is Eulerian if and only if (1) G is strongly connected[1] and (2) the in-degree of each vertex of G is equal to its out-degree.[2] *[Hint: Flow decomposition!]*

   (b) Suppose that we are given a strongly connected directed graph G with no isolated vertices that is *not* Eulerian, and we want to make G Eulerian by duplicating existing edges. Each edge e has a duplication cost $€(e) \geq 0$. We are allowed to add as many copies of an existing edge e as we like, but we must pay $€(e)$ for each new copy. On the other hand, if G does not already have an edge from vertex u to vertex v, we cannot add a new edge from u to v.

   Describe an algorithm that computes the minimum-cost set of edge-duplications that makes G Eulerian.



Making a directed cube graph Eulerian.

[1] A directed graph G is *strongly connected* if, for any two vertices u and v, there is a directed walk in G from u to v and a directed walk in G from v to u.

[2] The *in-degree* of a vertex is its number of incoming edges; the *out-degree* is its number of outgoing edges.
